The Global Rise of Multi-Drug Resistant Bacteria and Implications for Patients

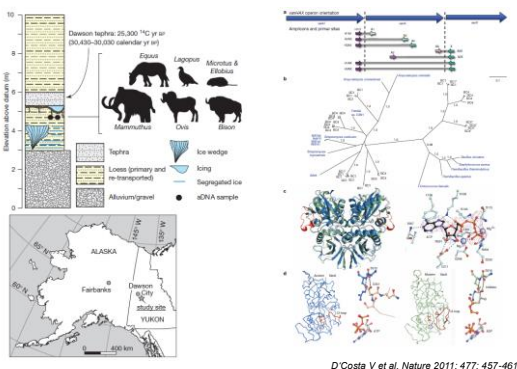

Prof. Dr. Christoph Lübbert, DTM&H

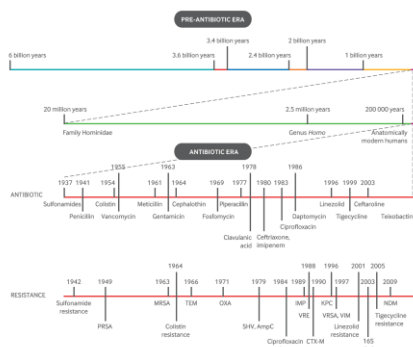

Head, Division of Infectious Diseases and Tropical Medicine
Department of Gastroenterology and Rheumatology
Leipzig University Hospital, Germany

Antibiotic resistance is ancient

Timeline of antimicrobial resistance

Iredell J et al. BMJ 2015; 351: h6420

RESEARCH ARTICLE

Antimicrobial Resistance: The Major Contribution of Poor Governance and Corruption to This Growing Problem

Peter Collignon^{1,2*}, Prema-chandra Athukorala^{3,4}, Sanjaya Senanayake^{5,6}, Fahad Khan⁶

AMR causes extra deaths

Main drivers of AMR

Figure 3: Role of modifiable drivers of antimicrobial resistance: a conceptual framework

Holmes AH et al. Lancet 2016

What is the problem?

The qualitative and quantitative use of antibiotics is equivalent to the development of resistance.

This is a natural law!

The resistance equation

Resistance genes + selection pressure
= Resistance problem

adapted from Werner Witte, Robert Koch Institute, Germany

Resistance genes and globalization

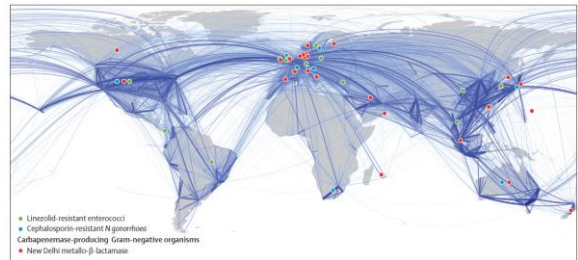

Figure 2: Worldwide travel routes and emergence of antimicrobial resistance

Although extended-spectrum β-lactamase-producing *Enterobacteriaceae* and MRSA are now nearly ubiquitous, certain novel types of resistance, among both Gram-negative and Gram-positive organisms, are of particular concern. The mechanisms of human-to-human transmission for these organisms are likely to be complex, but include association with travel. Data shown includes NDM-positive bacteria from patients with an epidemiological link to the Indian subcontinent, linezolid-resistant enterococci, and reported colistin/ceftazidime treatment failures for *Neisseria gonorrhoeae*. Flight path data developed by Dr Jonathan Read and Professor Tom Solomon, based on the number of commercial flight bookings made (number of travellers might be higher).

Lübbert C et al. Int J Med Microbiol 2015; 305: 148-56

Import of ESBL producers by travelers

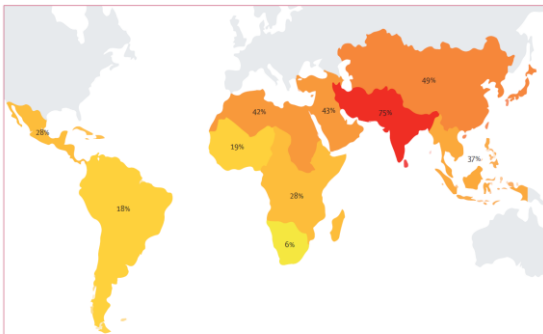

Figure 1: Percentages of travellers that acquired β -lactamase-producing Enterobacteriaceae per subregion, according to the United Nations geoscheme
Arcilla MS et al. Lancet Infect Dis 2016

Acquisition of ESBL producing Enterobacteriaceae by travelers – persistence and spread

packaged beverages showed no protective effect. The ESBL-PE persistence rate after 6 months was 8.6% (3/35). We conclude that global efforts are needed to address the further spread of ESBL-PE in the community. Active surveillance and contact isolation precautions may be recommended at admission to medical facilities especially for patients who traveled to India and South East Asia in the previous 6 months.

Lübbert C et al. Int J Med Microbiol 2015; 305: 148-56

Findings 633 (34.3%) of 1847 travellers who were ESBL negative before travel and had available samples after return had acquired ESBL-E during international travel (95% CI 32.1–36.5), with the highest number of acquisitions being among those who travelled to southern Asia in 136 of 181 (75.1%; 95% CI 68.4–80.9). Important predictors for acquisition of ESBL-E were antibiotic use during travel (adjusted odds ratio 2.69, 95% CI 1.79–4.05), traveller's diarrhoea that persisted after return (2.31, 1.42–3.76), and pre-existing chronic bowel disease (2.10, 1.13–3.90). The median duration of colonisation after travel was 30 days (95% CI 29–33). 65 (11.3%) of 577 remained colonised at 12 months. CTX-M enzyme group 9 ESBLs were associated with a significantly increased risk of sustained carriage (median duration 75 days, 95% CI 48–102, $p=0.0001$). Onward transmission was found in 13 (7.7%) of 168 household members. The probability of transmitting ESBL-E to another household member was 12% (95% CI 5–18).

Interpretation Acquisition and spread of ESBL-E during and after international travel was substantial and worrisome. Travellers to areas with a high risk of ESBL-E acquisition should be viewed as potential carriers of ESBL-E for up to 12 months after return.

NACHRICHTEN

Pharmastandort Deutschland: Apotheke der Welt war einmal

Deutschland ist heute nicht mehr die Apotheke der Welt. Dafür machte Professor Dr. Andreas Busch (Fakultät für Pharmazie der Universität Bonn) im vergangenen Jahr eine Reise in die Vergangenheit. Er hat in Deutschland neu auf den Markt gebrachten Wirkstoffen im vergangenen Jahr befinden sich nur fünf von deutschen Unternehmen.

Hierzulande wird dem Apotheker zufolge zwar mehr in Forschung und Entwicklung investiert als in jedem anderen europäischen Land. Im internationalen Vergleich ist es aber dennoch wenig. Die pharmazeutische Industrie in den USA gibt mehr als zehnmal so viel dafür aus.

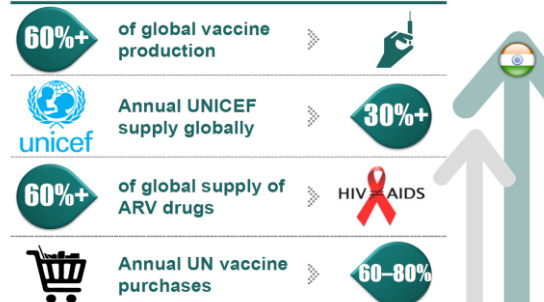

Um Forschung und Entwicklung in Deutschland wieder attraktiver zu machen, schlägt Busch Steuererleichterungen für Unternehmen vor, die sich in diesem Bereich engagieren. Er befürchtet, dass die bestehenden Besteuerungsregeln für Forschung und Entwicklung in Deutschland zu hoch sind. Als Beispiele führt er die umfassende Forschungsgemeinschaft an, die große Know-how im Bereich Technik und Herstellung sowie die hohe Dichte an Krankenkassen, welche für klinische Studien wichtig sind. Süddeutsche.de Panorama

7. Juni 2012, 12:00 Uniklinikum Leipzig

30 Tote nach Keimbefall

Es ist der größte bekannte Ausbruch dieser Art: Im Leipziger Universitätsklinikum haben sich in den vergangenen zwei Jahren 63 Menschen mit einem multiresistenten Erreger infiziert. Wie jetzt bekannt wurde, ist knapp die Hälfte dieser Patienten gestorben.

Eingeschleppt wurden die Erreger nach Erkenntnissen der Klinikleitung 2010 von einem deutschen Patienten, der auf Rhodos im Krankenhaus gewesen war. Er litt an

28% cancer patients
26% solid organ transplants
8% ECMO

Category	Count	Total	Percentage
Mortality rate	44	105	41.9%
KPC-2-KP infections	27	45	60.0%
Colonized by KPC-2-KP	16	60	26.7%

P = 0.001

Lübbert C et al. *Am J Infect Control* 2014; 42: 376-80

Figure 2: Kaplan-Meier survival plot. The plot shows the probability of survival (Y-axis, 0.0 to 1.0) over time in days after liver transplantation (LTx) (X-axis, 0 to 210). Three groups are compared: KPC-2-KP (solid line), SEN Klebsiella spp. (dashed line), and ESBL Klebsiella spp. (dotted line). The KPC-2-KP group shows the lowest survival, dropping to approximately 0.2 by day 120. The SEN and ESBL groups show higher survival, with the ESBL group having the highest survival, remaining above 0.6 throughout the 210 days. The p-value is 0.004 (log-rank test).

THE WELL-TRAVELED SALAD

Do You Know Where Your Food Has Been?

As consumers, many of us feel to recognize that even our domestic and local food supplies are part of a global network. The daily activity of consuming food directly links us to health as humans to the health of crops and producers, food animals, and the environments in which they are produced.
